The present invention relates to albumin fusion proteins comprising therapoutic protein X and human albumin (HA, also known as numan for albumin, HSA). The proteins are useful for treating a disease or disorder that may be modulated by therapoutic protein X. The albumin extends the shelf-life of protein X, and may increase its biological

albumin

CC AAD33692-AAD33736 represent cDNAs corresponding to 21 human secreted protein genes, and AAE21191-AAE21235 represent the proteins they encode. AAE21236-AAE21280 represent human secreted proteins they encode. CC AAE21236-AAE21280 represent human secreted proteins are useful for preventing, ctreating or ameliorating medical conditions, e.g., by protein or gene ctherapy. Pathological conditions can be diagnosed by determining the most therapy. Pathological conditions can be diagnosed by determining the presence of mutations in the new genes. Specific uses are described for each of the CC and include developing products for the diagnosis or treatment of the can be a conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the diagnosis or treatment of conditions of the conditions of the diagnosis or treatment of conditions of the conditions of the diagnosis or treatment of conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the

New fusion protein for treating disease e.g. diabetes comprises an albumin fused to a therapeutic protein  $\boldsymbol{\cdot}$ 

Claim 1; Page 1566-1569; 2102pp; English.

The present invention relates to albumin fusion proteins comprising a therapeutic protein X and human albumin (HA, also known as human serum albumin, HSA). The proteins are useful for treating a disease or disorder that may be modulated by therapeutic protein X. The albumin extends the shelf-life of protein X, and may increase its biological in vitro/in vivo activity. The protein is useful for treating and diagnosing disorders such as cancer, reproductive disorders, digestive disorders (e.g. Crohn's disease, ulcerative colitis), immune disorders (e.g. acquired immunodeficiency syndrome, AIDS), endocrine disorders (e.g. diabetes), haematopoletic disorders, neural disorders (e.g. alzheimer's, Parkinson's, Creutzfeldt-Jacob disease, encephalomyelitis, meningliis, schizophrenia), and connective disorders (e.g. osteoporosis, arthitis). ABG63326-ABG65518 represent albumin fusion proteins of the invention.

and their corresponding secreted proteins are useful for preventing.

C treating or ameliorating medical conditions, e.g., by protein or gene
therapy. Pathological conditions can be diagnosed by determining the
amount of the new protein in a sample or by determining the presence of
mutations in the new genes. Specific uses are described for each of the
21 genes, based on the tissues in which they are most highly expressed,
and include developing products for the diagnosis or treatment of
themune or autoimmune diseases e.g. AIDS (acquired immune deficiency
syndrome), asthma, anaemia and rheumatoid arthritis, breast neoplasia
and breast cancer, neurological diseases e.g. Alzheimer's disease,
cand breast cancer, neurological diseases, Fourette syndrome,
meningitis, demyelinating disease, peripheral neuropathies, meoplasia,
trauma, congenital malformations, spinal cord injuries, toxic
neuropathies induced by neurotoxins, peripheral neuropathies, multiple
sclerosis, ischaemia and infarction, haemorrhages, schizophrenia, mania,
dementia, depression, panic disorder, learning disabilities, ALS,
altered behaviours e.g. disorders in feeding, sleep patterns, balance
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Rosen

The gene is located on chromosome 15. The kinase polypeptides are useful for diagnosing a disease or disorder selected from cancers (e.g. cancers of tissues and cancers of hematopoletic origin), immune-related disease and disorders, cardiovascular disease, brain or neuronal-associated diseases (e.g. Alzheimer's disease, parkinson's disease, multiple sclerosis, metabolic disorders, peripheral nervous system diseases, amyotrophic lateral sclerosis, viral infections, infections caused by prions, infections caused by bacteria, infections caused by fungi, ocular diseases, migraines, pain, sexual dysfunction, mood disorders, attention disorders, dyskinesias, and organ transplant rejection. Kinase inhibitors are useful for treating diseases and disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               06-MAR-2000;

                                                                                                                                                                                            The invention relates human kinases (PKIN) and their corresponding CC nucleic acid sequences. PKIN and its DNA are useful for diagnosing, CC treating and preventing cancer, an immune system disorder (e.g., CC acquired immune deficiency syndrome (AIDS), Addison's disease, allergy, CC affecting growth and development (e.g., arteriosclerosis, cirrhosis, CC affecting growth and development (e.g., hypertension, myocardial) CC infarction, Goodpasture's syndrome), and a lipid disorder (e.g., fatty CC liver, Gaucher's disease, Niemann-Pick's disease, hypertcholesterolaemia, CC hyperlipidaemia, obesity), and for assessing the effects of exogenous CC condition or a disease associated with the expression of PKIN in a CC condition or a disease associated with the expression of PKIN in a CC condition or a disease or composition comprising PKIN or an agonist of PKIN is useful in a number of drug screening techniques and to analyse CC PKIN is useful in a number of drug screening techniques and to analyse CC the proteome of a tissue or cell type. PKIN DNA is useful for creating and in somatic or germline gene therapy. The present sequence is human or part of pkin writerin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gururajan

                                                                                         Percent Similarity:
                                                                                                                                                                                              polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymerase dependence tags for identifying expressed genes. (I) is useful in gene therapy techniques (II). (II) is useful for generating antibodies against it, detecting or quantitating a polymeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II), (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polymeptide and polymuclectide sequences have applications in clidagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and camino acid sequences. ABG00010-ABG3077 represent novel human the printed that the formulation is the formulation of the sequence of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                            diagnostics, responsible f biodiversity

The inventi useful in developmental biology and in elucidating cell signalling a cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins The sequence A----

N-PSDB; AAD36139.

Diagnosing cancer, comprises determining the upregulation of expression of a nucleic acid sequence encoding a protein kinase or upregulation of expression of the protein kinase, in the cancer

Claim 1; Page 60-62; 87pp; English.

The invention relates to a method for screening biologically active agent that modulates cancer associated protein kinase function. The invention also relates to a method for diagnosing cancer comprising determining the upregulation of expression of a nucleic acid sequence encoding a protein kinase. The method is useful for diagnosing cancer. A protein kinase is useful for screening biological agents that modulate cancer associated protein kinase function. Downregulating the activity of protein kinase is useful for inhibiting the growth of a cancer cell, e.g. liver or colon cancer. A nucleic acid encoding protein kinase is useful to screen biopsy derived tumours and inflammatory samples such as arthritic synovium, for amplified DNA in the cell or increased expression of corresponding mRNA or protein and is also useful to detect differences in expression levels such as molecular weight, amino acid and nucleotide sequences between the kinase, MAP3K11.

                                                                                                                        (AAV8289) Inserted between nucleotides 23050 and 2351, as set forth in AAV82889. The cDNA sequence is derived from clone NMDA24. The NMDAR subunits contribute to the formation of NMDA-activated cation-selective ion channels. In addition to being useful for the production of NMDA receptor subunit proteins, the nucleic acids are also useful as probes to identify and isolate nucleic acids encoding related receptor subunits. Functional glutamate receptors can be assembled from several NMDA receptor subunit proteins of one type (homomeric) or from combinations of subunit proteins of different types (heteromeric). The present invention also comprises methods for using such receptor subunits to identify and characterise compounds which affect the function of such receptors, e.g. agonists, antagonists and modulators of glutamate receptor function. The invention also comprises methods for determining whether unknown
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        WPI; 19
                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence represents a human N-methyl-D-aspartate (NMDA) receptor subunit (NMDAR). The nucleic acid sequence does not contain the 860 5'-most nucleotides, has an additional 11 nucleotides (AAV82891) between nucleotides 1300 and 1301, an additional 24 nucleotides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      DNA encoding N-methyl-D-aspartate receptor subunit assembly of functional glutamate receptor subunits

Nucleic acids encoding human kinase polypeptides, useful for preventing diagnosing and/or treating e.g. cancer, immune, cardiovascular and neuronal-associated diseases, and microbial infections

433pp; English.

AAU03501-AAU03557 represent novel human protein kinases #1-57. The novel protein kinases have been identified as members of the tyrosine or serine/threonine kinase (PTK and STK) families. The polynucleotides encoding protein kinases and the polypeptides may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate kinase expression. For example, they may be used to treat cancers (especially cancers of haematopoletic origin), cardiovascular disease (e.g. HIV) and reproductive disorders (e.g. infertility). Additionally, polynucleotides encoding protein kinases may be used for gene therapy and as DNA probes in diagnostic assays. The protein kinase polypeptides may be used as antigens in the professional protein kinase polypeptides may be used as antigens in the professional protein kinase polypeptides may be used as antigens in the professional protein kinase polypeptides may be used as antigens in the professional prof of antibodies against the protein kinases and acmodulators of protein kinase expression and ac disease (e.g. atherosclerosis), metabolic disorders (e.g. diabetes), immune related diseases (e.g. rheumatoid arthritis), neurological disorders (e.g. schizophrenia), neurodegenerative disorders (e.g. Parkinson's disease), inflammatory disorders (e.g. asthma), infectious disease, (e.g. utv.) s antigens in the production in assays to identify

The CDNA sequence is derived from clone NMDAR1. The NMDAR subunits contribute to the formation of NMDA-activated cation-selective ion channels. In addition to being useful for the production of NMDA receptor subunit proteins, the nucleic acids are also useful as probes to identify and isolate nucleic acids encoding related receptor subunits. Functional classifies of one type (homomeric) or from combinations of subunit proteins of one type (homomeric) or from combinations of subunit proteins of different types (heteromeric). The present invention also comprises compounds which affect the function of such receptors, e.g. agonists, antagonists and modulators of glutamate receptor function. The invention also comprises methods for determining whether unknown protein(s) are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present sequence represents a human N-methyl-D-aspartate (NMDA)
